

FRTS API Guide

These are some basic rules, patterns and codes to help engineers understand and use the new Co-op TCG FRTS Ordering Platform (FOP).

The APIs have been previously shared, currently at draft version `0.4.0`.

Rules

1. All API end points, GET or POST, require query parameter `partnerId`. If the Partner Id is missing or invalid, a HTTP Error code 406 will be returned, and an identifiable log entry is made in FOP.

Response codes

Code	Description
200	Success
204	Success. No more data available when used with pagination
400	There was an issue with the format of the request or URI.
401	(Cloud Platform) Unauthorised access due to any one of: • IP address restriction • Missing or invalid OAUTH token
403	(Cloud Platform) Unauthorised access due to any one of: • IP address restriction • Missing or invalid OAUTH token • Managed Identity or Service Principal issue
404	(Cloud Platform) The URI is invalid

406	Not accepted, access due to any one of: • Partner Id is invalid • Partner is not allowed to use the current function. This is set in ISM configuration.
500	Internal platform error
505	The API version is no longer supported. For example using v1 in the URL when v2 is now the only supported version.
540	Temporarily Disabled. FOP configuration.

API pagination

The shared Open API specs include the **page** query parameter, and the 204 HTTP response code. This will allow FOP and the ISMs to exchange large amount of data while not causing any timeouts in the API requests.

The **page size** will be maintained with the platform and not shared with the ISMs. This is not for any security reasons, but to allow FOP to adjust to page sizes for performance and tuning.

The suggested approach to using the API is:

For a single page

When a request is made to an API with the page number 1

And the response contains an array of data that has a length that is equal to the total property

Then an additional call to the API with page number 2 is not required.

For multiple pages

When a request is made to an API with the page number 1

And the response contains an array of data that has a length that is **LESS THAN** the total property

Then keep calling the API, each time incrementing page number.

Until the API returns a HTTP response code of 204, meaning no more content is available.
